Plastic surgery

Prof. Dr. med. Nektarios Sinis

Plastic, Hand and
Reconstructive microsurgery

We attend all skin and soft tissue defects

Department

The Department of Plastic, Hand and Reconstructive microsurgery specializes in the treatment of complex, chronic wounds as well as in the management of soft tissue defects after diseases, injuries and infections. Further focal points are the microsurgical reconstruction of the female breast after breast cancer and the treatment of all degenerative and chronic diseases of the hand.

Thereby the house ensures an elective hand surgery and emergency care treatment as well as a microsurgical replantation treatment of the extremities.

The health care provision of tumors in the head and neck area under the aspects of plastic surgery is also part of our care spectrum.

As one of the few hospitals in Germany, we stand by our clients as a competent partner in all types of neck and arm nerve plexus injuries, facial nerve paralysis and provide safety and competence in the treatment of burns. According to the disease and indications an inpatient as well as an outpatient treatment is possible.

In this process we emphasize on modern reconstruction techniques and on the establishment of a trust based relationship with the patient. Every patient will be given an individual treatment plan and a humane oriented nursing care and attention.

Spectrum of services
